Welcome to the Debrief Tutorial. This tutorial consists of a set of self-teach tutorials (Cheat Sheets) that you will use to learn about Debrief. In working through the tutorials you’ll encounter the breadth of the Debrief application, ready for using the tool for your own analysis.

## 1 Getting Started with Debrief

1.1 Welcome to Debrief NG

1.1.1 Background Information

1.1.2 About these Tutorials

1.1.3 Document Conventions

1.1.4 Navigating within Debrief

1.2 Installing and Opening Debrief

1.3 Welcome Screen

1.4 Views Overview

1.5 Debrief Preferences

1.6 Working Within Debrief

1.6.1 Opening the Navigator view

1.6.1.1 Opening Views

1.6.1.2 Opening and Closing Views (Using Quick Access)

1.7 Working with Views

1.7.1 Moving Views

1.7.2 Resizing Views

1.8 Defining Your Workspace

1.8.1 Generating a Project for Your Data

1.8.2 Generating Links to Your Existing Data

1.8.3 Configuring Background Data

1.8.3.1 Getting Natural Earth Dataset

1.8.3.2 Configuring Debrief with Natural Earth Data

1.9 Menus
1.13.2 Undo a Chart Feature
1.13.3 Temporarily Hide a Chart Feature
1.13.4 Remove a Chart Feature

2. Working with Debrief NG

2.1 Working with Data
2.1.1 Creating a New Plot
2.1.2 Adding Data to a Plot
2.1.3 Editing Data
  2.1.3.1 Edit a Position
  2.1.3.2 Edit an Entire Track
  2.1.3.4 Edit Directly from the Plot
2.1.4 Analysing Sensor Data
  2.1.4.1 Sensor Formatting Options
  2.1.4.2 Format Sensor Data
  2.1.4.3 Conduct a Plot-Lock
  2.1.4.4 Commence Plot-Lock
  2.1.4.5 Start Dragging

3 Controlling What You View

3.1 Filtering your View
  3.1.1 Hiding a Shape
  3.1.2 Hiding Entire Layer
  3.1.3 Filtering to a Time Period
3.2 Assessing Primary and Secondary Tracks
  3.2.1 Viewing Track Tote
  3.2.2 Understanding Track Tote
  3.2.3 Moving Track Through Time
  3.2.4 Removing a Track from the Tote
3.2.5 Adding a Track to Tote 88

3.3 Viewing Time-related Vessel Tracks 89

3.3.1 Viewing the Time Controller 90
3.3.2 Moving Slowly Through Data 90
3.3.3 Moving Quickly Through Time Period 90
3.3.4 Experimenting with Time Format Options 91
3.3.5 Changing Plotting Modes 91
3.3.6 Working with Time Periods 92
3.3.7 Selecting Precise Time 93
3.3.8 Time Controller's Editable Properties 94
3.3.9 Bookmarking the Current Time 95

3.5 Analysing Time-related Calculated Data 96

3.5.1 Process Overview 97
3.5.2 Selecting Required Tracks 98
3.5.3 Opening the XY-plot 98
3.5.4 Navigating Around the Plot 100
3.5.5 Measuring Range and Bearing 102
3.5.6 Tracking Other Objects 104

3.6 Narrative Data 110

3.6.1 Loading Narrative Data 110
3.6.2 The Narrative Viewer 112
3.6.3 Filtering by Source 114
3.6.4 Filtering by Type 114
3.6.5 Two-way Linking of Narrative to Current Time 115
  3.6.5.1 Jump to a Specified Time 116
1 Getting Started with Debrief

1.1 Welcome to Debrief NG

Welcome to Getting Started with Debrief. In this tutorial, the first in a series aimed at getting you up to speed with the program, we will look at the following areas:

- Document conventions
- Installing and opening Debrief
- Welcome to, and working within, Debrief
- Debrief Preferences
- Views, Menus, Plot Editor, and Toolbars
- Shortcut Key Combinations
- Chart Features

By the end of this brief getting started guide, you will know where everything is in the program, how to work efficiently within Debrief, and be in the best position possible for the remaining tutorials.

Before going through the areas of Debrief in detail, it is important to know what Debrief is all about. So let us started with a little background information.

1.1.1 Background Information

Debrief was developed in the mid 90's by the Maritime Warfare Centre in Portsmouth UK to support the analysis and reporting of maritime tactical exercises, and is a free, open source application that makes it possible for analysis organisations to run open contests for support and development contracts to maintain or extend Debrief. For more information, refer to http://debrief.info.

1.1.2 About these Tutorials

Though there is a wealth of information in these tutorials to get you both started and up to speed quickly, this will only be achieved by an active involvement on your behalf. As such, in most procedures you will see checkboxes in the right margin. These are there to not only check your progress but also to help directly involve you while you proceed with learning how to use Debrief. For example, you will see something similar to the following:

1. You will need the following items to work through the tutorials:
   - A pencil/pen to tick off these checkboxes.
   - Access to a PC
Have either pre-installed copy of **Debrief**, a Debrief CD, or an Internet connection to download a copy.

2. Having read the previous, do you understand what will be covered in this, the first tutorial of **Debrief**, and what items you need?

By checking off these boxes as you go, you can track your progress and see how well you’re doing.

### 1.1.3 Document Conventions

The following conventions are used within the tutorial:

- **Bold** is used to identify commands, verbal instructions and other essential information, such as user interface (UI) details/buttons/names, and for emphasis.

- “**Bold + quotes**” are used to identify filenames and other external references.

- “Quotes” are used to highlight comments in examples.

### 1.1.4 Navigating within Debrief

When you’re navigating within Debrief, you will need to click on menus, sub-menus, and even sub-sub menus. However, though writing it out as “Click on **File** on the menu bar, then click on **Save As**, and finally navigate to where you want to save your file,” is descriptive and accurate, it’s pretty laborious and wasteful; so, we shorten it and write it as:

**File > Save As > file location**

That’s far more succinct and easier. Next we’ll look at installing and opening Debrief.

### 1.2 Installing and Opening Debrief

Before you install **Debrief**, please check the following:

- The main prerequisite for installing **Debrief** is to have the latest version of Java installed. So download Java from [Java link](https://www.java.com/en/).  

- If you haven’t installed Debrief before, ensure you have downloaded the latest version from Github ([https://github.com/debrief/debrief/releases](https://github.com/debrief/debrief/releases)).
If you have an older legacy version of Windows already installed on your computer, then please uninstall that version via Windows > Start menu > Settings/Control Panel > Add/Remove Programs.

Once you’re ready to go with the latest version of the software:

1. Unzip it to your computer/network.

2. Navigate to the DebriefNG folder, then double-click on the “DebriefNG.exe” file to run the application.

It will take a few seconds to load and, once loaded, you will see the Welcome to Debrief NG page.

1.3 Welcome Screen

The Welcome screen is displayed on your first visit to Debrief, but it is always accessible from within Debrief via the Help menu.

When the page loads, you will see the Welcome screen:
As you can see, this contains the following 5 buttons:

1. **Overview** - if this is your first time using Debrief, it's a good idea to click on this button to get an overview of the features.

2. **What's New** - we’re constantly updating the software, so if you want to see the exciting new features, click on this button.

3. **First Steps** - we all have to start somewhere; so, if you’d rather read the first steps than follow this tutorial, then feel free to click here.

4. **Tutorials** - if you click on this option, then you'll see another version of this tutorial. However, it's always handy to know where to find these.

5. **Workbench** - the workbench is the main interface for performing your plot analysis and other tasks: this is the place where you will do all your work.

I know you’re raring to go, so we won’t go into all the features or what you will find by clicking on the above, but I would recommend you to explore and familiarise yourself with those elements when you have the time.
For the next sections, if you’re an experienced computer user then you’ll already know about main menus, context-sensitive menus and toolbars; if this is the case, feel free to skip them. However, I would recommend that you do read the section on Views as they are an important component of Debrief.

1. Click on the Workbench button. The Welcome screen will close and you will see the Create Project dialog box.

2. Every Debrief project requires a location to save the file. name, so click Browse and select the location where you want to save the file.

3. You can leave the Add Debrief Samples box checked.

4. Click on the Finish button. The dialog box will close and you will see an empty Debrief interface consisting of various items and objects (we will go over these in a second).

5. If you look in the Navigator ‘window’, you will see your new project name folder.
1.4 Views Overview

In Debrief, each small window is called a View. There are different types of view, all of which perform different functions. You already saw the Navigator View. If you click on the Time Controller tab (next to Navigator), you'll see we have a set of video-type controls: very useful for displaying time elements in Debrief.

Underneath these 2 views are 3 other views:

Properties
Again, each of these views performs a different function. We won't look at these now, but these views and other interface items such as toolbars, menus, and the plot editor (the large empty space to the right of the views) make up a large part of Debrief.

Please note that there are several other views that you can add whenever required from the Windows menu. For more information, refer to the following tutorials:

- Working within Debrief
- Working with Views

Currently, you will not see any data loaded and the interface may seem a little daunting at first, but we'll work through all of these items and you'll come to realise that it's actually quite easy to work with.

However, as with any new application, it's a good idea to configure it exactly how you want it for your own purposes. In Debrief, these are called Preferences and, though you don't know that much about the software as yet, you will understand each of these settings.
1.5 Debrief Preferences

As mentioned, all software is configured a certain way ‘out of the box’, and Debrief is no different. However, it’s most likely that you’ll either want to change the way it’s setup or know where to make the changes if you later decide to do so. For example, if you prefer Over the Ground (OTG) as the default import mode for track files, then you can change the setting here; the same if you wanted your default range units in miles or nautical miles, etc.

Debrief offers a large number of different settings and configurations to suit the needs of its users, all of which can be changed if you prefer alternatives to the preset ones. To change these, follow the steps given below:

1. In Debrief, click on Window > Preferences. The Preferences dialog will open.

We will now look at some of the important settings. Though we won’t change any of the settings (as it’s setup just right for the subsequent tutorials), it’s handy to know where they are, before you start using them.

2. Click on Maritime Analysis and you will see 3 settings groups: Default Track Import Mode, Default Range Units, and Relative Bearing Format.
3. Again, we will leave these at the default setting, but just check that you want Ask User for the Default track import mode, yd for the Default range units; and UK format (R180,G180) for the Relative bearing format. If not, make your change(s).

4. Once you are done, click on the Apply button to commit the changes: Apply makes the changes and leaves the dialog box open, whereas clicking on Ok commits the changes and closes the box.

Now we will look at the different location format options.

5. Click on the drop-down arrow next to Maritime Analysis and select Formatting.
6. You can now choose your location format, either DD°MM.MMM’ or DD°MM’SS.SSS”—again, we want the default option.

7. If you have downloaded the “Natural Earth” set, click on this in the Maritime Analysis sub-menu.
8. Click on the **Browse** button, navigate to the download location, and double-click on the file to load it.

9. Finally, click on the **Ok** button.

Those are the only settings we need for our tutorials. For the other preference settings, refer to the **User Guide** for further information. Now we will look at working with **Debrief**.

### 1.6 Working Within Debrief

The UI for **Debrief** (called the **workbench**) is centred on what is called the **plot editor**; and again, this in turn is surrounded by a series of small windows, called **views**. We'll come onto these shortly, but the **plot editor** is where your plots will be displayed and where you can work on them.

Within the workbench itself, the base component for working is the project (we already created our base project in the previous section, **Welcome to DebriefNG**), and everything we see in the UI is related to the selected project.

The first thing we must do is to define the workspace for this project. To do this, we need to ensure the **Navigator** view is open; and, unless you accidentally closed it, it should be; but we'll quickly go over 2 methods of opening this view as it is one of the more common views in **Debrief**. The **Navigator** view to **Debrief** is akin to Windows Explorer to your operating system, so it's essential to know how to open it.
1.6.1 Opening the Navigator view

The easiest ways to open the Navigator view are either via the menu or the Quick Access dialog.

1.6.1.1 Opening Views

To open views using the menus (remember, we’re just concerned with the Navigator view here, but these steps apply to any Debrief view):

1. Click on Window on the menu bar.

2. Mouse-over or click on Show View.

3. Click on Navigator and that view will open.

Using the convention I described before, this would be:

Window > Show View > Navigator.
We will use this convention from here on.

However, a much quicker way to open a view is to use a keyboard combination—a sequence of key presses to perform an action; the only difference here is you must know the name of the view you want to open.

### 1.6.1.2 Opening and Closing Views (Using Quick Access)

To open the **Quick Access** dialog and locate any item within **Debrief**:

1. Press **Ctrl+3** on your keyboard and the **Quick Access** popup dialog will show.
2. In this instance, we are searching for the **Navigator** view, so just start typing ‘navigator’ into the search field and, before you’ve finished typing the word, you will see **Views - Navigator - General** appear.
3. Click on it and the **Navigator** view will show in the top left of your window.

The **Quick Access** dialog also ‘remembers’ your choices, so the next time you open it you will see recently selected items listed beneath the search field; just click on the one you want and it will open.
As you can see, opening views is easy; so is closing them: to close a view, click on the X icon on the view name tab.

Now we’ve looked at opening and closing views, let’s have a look at them in a little more detail.

1.7 Working with Views

As mentioned, views are small viewing panes which present information specific to the task you are carrying out in the plot editor in different ways. For example, one view may display tabular information about the properties of an object: its position, its color, etc., (the Properties view); whereas, another will have video controls to show time (the Time Controller view); and yet another will show a graphical overview of the chart in use (the Chart Overview view). Again, views display supporting data or properties about the selected data or tasks. As you will see, they are an important element of Debrief and you will use them extensively.

Note: Selecting a view makes it active. The active view will have its name tab in blue color and it will also have a blue border. You can use the Ctrl and Shift key on your keyboard to select multiple objects; when this occurs, all the selected items become active. We already know how to open and close views, it is time to know how to reposition or move them.

1.7.1 Moving Views

Moving views is very easy and they can be positioned anywhere around the plot editor by dragging-and-dropping. This is very handy as not only can you move the important features into prominent positions on your monitor when you need them, but you can also move them out of the way, onto another monitor (if you have multiple monitors), or even drop them into an already open view to stack them up (to save screen space). Try it:

1. Click on the tab of any open view to make it active (the tab will turn blue).

2. Now, click on the tab itself and, keeping the mouse button pressed, drag it across the plot editor area. As you approach the edges of the plot editor, you will see the
cursor change to a black direction arrow and a placeholder box will appear to one side of the plot editor; if you wish, you can drop the view into place there.

3. However, if you drag it further onto to another view, the cursor will change to a graphical set of files (or folders); you will also see a shaded border around the view you are over, showing you where it will be placed. If you drop it now, the view will add to that view set (or stack), and become active.

4. But, if you didn’t drop it on the view, deciding instead to drop your cursor either onto the name tab of the view you are over or right next to it, you will see a dotted box appear showing you where your view will be placed. As soon as you drop the view, it will dock in that position and become the active view.

Note: within the confines of the central editor pane, you can also do the same with the plot editor.

1.7.2 Resizing Views

In addition to the standard Windows minimize and maximize functionality (the two small icons in the top right-hand corner of each view), you can also resize views by
moving your mouse cursor over the view’s border. As soon as the cursor changes to a directional arrow, left-click on the border and then drag it in one of the indicated directions. Once it’s in position, release the mouse button. Try this with the Navigator view now.

As you probably realise, many of Debrief’s functions are centered around using the mouse, so we’ll first look at menus and then at toolbars.

1.8 Defining Your Workspace

In the previous tutorial, we learnt about the workbench (the Debrief UI), and in this section, we will look into defining your workspace covering the following sections.

- Generating a Project for Your Data
- Generating Links to your Existing Data
- Configuring Background Data

1.8.1 Generating a Project for Your Data

Before we create a new project, we first need to check whether or not we need one.

Check Whether You Need a Project

If the Navigator view has no data, then you will need to create a new project. If the Navigator view already has a folder icon (possibly containing sample data), then you’re ready to go on to the next section in this tutorial.

Create a General Project

To create a general project, follow the steps given below:

1. Right-click anywhere in the Navigator view, the sub-menu will display.

2. Click New and from the New sub-menu, select Project…

<table>
<thead>
<tr>
<th>New</th>
<th>Debrief Project</th>
</tr>
</thead>
<tbody>
<tr>
<td>Copy</td>
<td>Project...</td>
</tr>
<tr>
<td>Paste</td>
<td>Folder</td>
</tr>
<tr>
<td>Import...</td>
<td>Debrief Plot</td>
</tr>
<tr>
<td>Export...</td>
<td>Example...</td>
</tr>
<tr>
<td>Refresh</td>
<td>Other...</td>
</tr>
<tr>
<td></td>
<td>Ctrl-N</td>
</tr>
</tbody>
</table>
3. The **New Project wizard** will open. Click on the **General** folder, then select **Debrief Project**.

![New Project wizard](image)

4. Click on the **Next** button. **Create a project** dialog will display.

![Create Project dialog](image)

5. Select the location where you want to place the project files by clicking **Browse** button. You can even create a new folder and place the files.

**Note:** If the project with the same name is already loaded in **Debrief**, then you may have to select a new location or folder.
6. Click on the **Finish** button.

You will see the new project in the **Navigator** view.
1.8.2 Generating Links to Your Existing Data

As mentioned previously, Debrief NG stores its data in a local folder called a project. While these are frequently created afresh to store new analysis data, it's also possible to denote your existing data directories as sub-folders (via links).

The following procedure guides you through generating links to your existing data folders. However, if the Create Project form opened when the application started, and if you provided both a project name and indicated that you would like sample data to be imported, then you can skip the following steps and move on to the next tutorial, Viewing Data.

Open Navigator

If the Navigator view is closed, open it by using the shortcut key Ctrl+3, and then either clicking on the option in Previous Choices, or starting to type navigator in the search field and clicking on the appropriate link when it appears.

Check Whether You have a Workspace or Not

Before you can link the existing data, you need to define a project for your work. If your Navigator view has no data, you must follow the Generating a Project for Your Data tutorial.

Add a New Folder

To add a new folder, follow the steps given below.

1. Right-click on your current project in the Navigator view, the New sub-menu will show.
2. Select **Folder** and the **New Folder** wizard will open.

Here instead of creating a fresh child folder to store our data, we're going to link to an existing folder.

3. In the **New Folder** wizard, click on the **Advanced** button, and the **Advanced options** will show.
4. Select **Link to alternate location (Linked folder)**.

5. Click on the **Browse...** button and navigate to an existing data folder on your machine or the network.

6. Once complete, click on **Finish** to close the wizard and link to your existing data.

**Note**: if you don't have your own data, please use either of the following:

- For a deployed **Debrief**, use the **“sample_data”** folder that's installed in your **Debrief** installation folder.
- If you are running a development version of **Debrief**, use `org.mwc.cmap.combined.feature/root_installs`

If you have followed these steps, you will have created a link to the sample data; however, if you need to load data from other data directories, repeat this process as often as required, but use a shared working folder.

### 1.8.3 Configuring Background Data

In addition to plotting your recorded vehicle data, **Debrief** is capable of showing a number of datasets in the backdrop form.

In the past, we offered the Vector Product Format (VPF) vectored dataset and the ETOPO-2 gridded bathymetry, but these have been superseded by the shiny new **Natural Earth**.
**Note:** All **Debrief** installations come with a small, low resolution Natural Earth dataset. But you can even download and install two much higher resolution datasets (in a single download). This higher resolution dataset includes many names of physical features and locations.

### 1.8.3.1 Getting Natural Earth Dataset

So by default, **Debrief** has a small, low resolution subset of the **Natural Earth** dataset, sufficient to provide coastlines and country boundaries. With higher resolution data, you can make your analysis plots much more attractive.

Your workplace may already have a network copy of **Natural Earth**; and, if your IT security policy permits it and you have sufficient storage space on your machine, you can copy the data to your hard drive for better performance.

1. If you don't have access to a copy, navigate to [https://github.com/debrief/NaturalEarth](https://github.com/debrief/NaturalEarth)
2. Click **Clone or Download** drop down list and click **Download zip** button (file size is approximately 25 MB).

Once you have downloaded the zip-file, just unzip it and save it to a safe place on your hard drive.

### 1.8.3.2 Configuring Debrief with Natural Earth Data

The next step is to configure **Debrief** with the **Natural Earth** data:

1. Click on **Window > Preferences** (or press Alt, W, P). The **Preferences** dialog will display.
2. Click on the arrow next to Maritime Analysis and select Natural Earth.

3. Click on the Browse button to navigate to your unzipped Natural Earth folder.

4. Click on Ok.

1.9 Menus

Debrief has a number of different menus which provide different functions. These are the main menu, context-sensitive menus, and view drop-down menus. We’ll look at each of these in turn.

1.9.1 Main Menu - Reduced

Without a Debrief file open, you will only see a reduced main menu set of 5 items: File, Edit, Run, Window, and Help. So, we'll open a file to see the full set.
1.9.1.2 Opening a Debrief file

To manage or open files, we need to go to the Navigator view. If it isn’t open, open it. You can either:

- Click on Window > Show View > Navigator.
- Press Ctrl+3 > Quick Access > [click on Navigator - General]

Now, in the Navigator view:

1. Click on the drop-down arrow next to “Debrief” and it will expand.

2. Click on the “sample_data” folder and locate the file “boat1.rep”.

3. Double-click on “boat1.rep” and the Select track mode dialog will show (remember, we accepted the default in Preferences to always ask us the track mode).
4. Select **Over the Ground (OTG)**.

5. Click on **Ok**. After a second or two, the **boat1.rep** plot will display in the plot editor part of the UI.

You will also see the full main menu set as well as the main toolbar set.
1.9.2 Main Menu - Full

The 8 main main menus items are File, Edit, Run, Chart Feature, Drawing, View, Window, and Help. These are self-explanatory and mostly mirror many of the principal functions common throughout apps/programs today.

Using the menus is very easy, especially with the mouse. However, you can also access the main menu items using the keyboard. We’ll discuss more about this in Shortcut Key Combinations.

The second type of menu we have are called context-sensitive menus.

1.9.3 Context-Sensitive Menus

One mostly unused function when using the mouse with Windows is the right-click mouse button or the right-click keyboard button (this is the one with the graphic on it, normally 2 to the right of your keyboard space-bar).

Using either of these functions will cause a pop-up menu to appear—this is called a context-sensitive menu. Try it now.

In the plot editor:

1. Right-click on the grey area of the plot. You will see a popup menu with 3 options: Copy Cursor Location, Edit base chart, and Edit Projection.

Admittedly, these aren’t much help to us at the moment, but it’s a quick way of accessing required information or attributes and functions of the chosen object.

2. Now, at the top of the track (the entire line on the plot is the track), you can see a straight yellow section. Right-click anywhere on it and a context-sensitive menu with a large range of options will display.
3. The 3rd option down is **Reset color**; select it and that small part of the yellow track will change color to red.

Of course, there are many other things we can do with these options, but it’s handy to know they are there and it’s far quicker than using the main menu all the time.

You might think this is no big deal, but when you’re using a computer all day shortcuts like this help enormously. As well as saving you time and energy, these context-sensitive menus also show you what other functionality is available to you; and, as well as being a neat training aid, are great for improving your efficiency and capability with the program. The last menu set is the view drop-down menu.

### 1.9.4 Viewing Drop-Down Menus

All views have a drop-down menu which further narrows-in on the functionality for the particular subset of tasks you are performing. For example, not only can you right-click on every individual element or attribute in a view, but you can also click on objects such as column headings as well as the small drop-down arrow in the top right-hand corner of each view: each one will provide with you a new set of options specific to that attribute/view.

With our **boat1.rep** file:
1. Identify the **Outline** view (if it isn’t visible, open it: **Window > Show View > Outline**).

2. Within that view, click on **Track: NELSON** to expand it. You should see **120500.00 (402 items)** as the first item in the list (this contains the information about the entire track in our plot editor).

3. Right-click on **120500.00 (402 items)**.

4. Mouse-over **120500.00** and another popup will show.

5. Mouse-over **Llinestyle** and select **Long dashes**. The track now changes to long dashes.
Next, we’ll go one step up, to the track-level:

1. Still in the Outline view, right-click on Track: NELSON.

2. Mouse-over NELSON and a popup will show.

3. Mouse-over Color and select Blue, most of the track will change color to blue.

Now, we’ll go another step up, this time to the view-level:
1. Click on the square icon (Hide Item) in the **Outline** view. The track will disappear from the plot (it’s still there, just hidden).

![Outline View](image)

2. Click on the checked square icon (**Reveal Selected Items**) and the track will be shown again in the plot editor.

**Note:** You can perform these functions at different levels in the view, e.g., you can also hide/reveal at the track and node levels, but it all depends on what you are actually working on in the plot editor.

### 1.10 Plot Editor

The **Plot Editor** itself is locked to the centre of the user interface, and is where you view and work on your projects. You can have multiple files open in the central area, each of which has its own tab (though I wouldn’t recommend too many as it will become cluttered).

If you do work in a plot editor, then an asterisk (*) will appear in its tab, denoting any unsaved changes.

With the changes, we made to the **Nelson** track in the previous section:

1. Click on **File > Save** and because our original file has been changed we must save it as a different format (we will come onto the different file types later).

2. Click on **Ok** and the **Save As** dialog will display.

3. Select the project folder you created earlier, and click on **Ok**. The “**boat1.rep**” file will be saved as “**boat1.dpf**”. The active plot tab name will change, and the asterisk will disappear.

**Note:** You can also press **Ctrl+S** on your keyboard to save the active plot.

#### 1.10.1 Navigating within the Plot Area

In addition to using the mouse to move around the plot area, there are other ways of navigating, including using the tab key to cycle through the 5 drag modes, as shown below. If you have a mouse with a wheel, you can press the **Ctrl** key and then use the mouse wheel to zoom in and out of the plot.
1.10.2 Moving Plots

You can move the plot order by clicking on the plot’s tab, and then dragging it into a new position alongside an existing tab.

1. In the Navigator view, double-click on the file “boat2.rep” to open it.

2. Select Over the Ground (OTG), then click on Ok. The file will display in a new tab.

We now have 2 tabs open: boat1.dpf and boat2.rep.

3. To move them, click and hold on the boat1.dpf tab.

4. Either drag the tab on top of or next to the boat2.rep tab (you will see the mouse cursor change to a stacked file set and a shaded box will appear).

5. Release the mouse and the tabs will have swapped positions.

Now, we’ll take this one step further and view multiple plots.

1.10.3 Viewing Multiple Plots

Debrief allows you to view multiple plots in one window (much in the same way as you can arrange windows in other applications):

1. Click and hold on the boat2.rep tab to select it.

2. Now, depending on where you want to position the boat2.rep editor in relation to the boat1.dpf editor, drag the selected tab towards the edge of the screen (top, bottom, left or right). As you go, you will see the stacked files mouse cursor change to a
black arrow and a shaded box will appear showing where the editor will be placed if you release the mouse.

3. Release the mouse where you want the **boat2.rep** file to be positioned. The plot will then show in the new location.

You can repeat this process with other files to further segment your plot editor area.

**1.10.4 Rearranging or Removing Plots**

- **To rearrange plots:** Drag-and-drop a plot onto the top, side, or bottom of another plot and, when the shadow border that shows where the plot will be positioned is in the right place, release the mouse.

- **To remove plots:** Either close the plot by clicking on the X in its tab, press **Ctrl+W** on your keyboard, or click on **File > Close**.

Do this now with the **shapes.rep** plot:
1. Open the `shapes.rep` plot as you opened `boat1.rep`.

2. Click and hold on the `shapes.rep` tab to select it.

3. Drag the tab on top of the `boat1.dpf` tab and, when the shadow border appears, release it.

4. Now, click on the X in the `shapes.rep` tab to close it.

You should now have `boat1.dpf` and `boat2.rep` side by side. We will now look at Debrief’s toolbars.

1.10.5 Exporting Plot

As an analyst, you will frequently use Debrief plots in various applications, either in vector (WMF) or bitmap (BMP) formats. Based on the application, you can adjust the size of the plot to maintain uniformity.

In addition to using still snapshots of Debrief plots in PowerPoint, it’s possible to include animations of vessel interactions. These animations add very little to the file size (typically 10s of KBytes) and don’t pose the security risk that Macros can do. Furthermore they can convey the vessel interactions in a more engaging way.

Dynamic PowerPoint animations are produced by adding a collection of Debrief-style icons to a master template slide. The master template will contain a background, placeholders for the map, time, and narrative events, plus some styled graphics that are used as donor elements for the Debrief symbols. So we configure a master template first before exporting a plot to PowerPoint.

In this section, you will learn how to set the master template, how to resize the Plot Editor and how to export the resized dynamic scenario to PPTX. For more information, refer to the following sections:

- Configuring Master Template
- Resizing Plot
- Preparing to Present
- Exporting Dynamic Scenario to PPTX

1.10.5.1 Configuring Master Template

When you want to use an animation of a dynamic scenario, of a plot, in your presentation, the size of the plot must be uniform. This will make your presentations more appealing. For that we need to configure the master template of the application and resize the plot to the same size as that of the master template. This way you can ensure that the aspect ratio of the plot will not be distorted, when you export it.
Let's configure the master template.

1. Navigate to **Window > Preferences**. The **Preferences** dialog will display.

![Preferences dialog](image)

2. Click on the arrow next to **Maritime Analysis**. The drop down menu will display.

3. Click on **Debrief-specific settings**. The **Debrief-specific settings** will display.

4. Click on the **Browse** button and select the master template by navigating to the **Debrief** folder (on your system) > **sample_data** > **other_formats** and then selecting the **master_template.pptx** file.
5. Note down the Map element dimensions (Width 528px and Height 368px of the master_template).

6. Click Apply and then click OK. The selected preference will be set.

Opening Sample Scenario

Before you start exporting, you need to open the sample scenario, the plot of which you wish to export.

1. In the Navigator view, drag the file sample.dpf and drop it into the Plot Editor. The sample.dpf tracks will display.

2. Click on the Fit to window button to make the entire plot visible.

1.10.5.2 Resizing Plot

If the size of the exported PowerPoint slide (or if a Debrief plot is copy/pasted as a still image to PowerPoint) is different than the size of the plot, the plot image will be resized and as a result of which some hairwidth lines may disappear in the image, particularly if presented via a projector. So, you would require to make the Debrief plot either the exact same size as the PowerPoint slide or to make the Debrief plot have the same aspect ratio as the target location.

**Note:**
- You can also export a plot, as a still image, to vector (WMF) or bitmap (BMP) formats. To export to WMF format, navigate to File > Export to WMF. The exported file will be saved in the Debrief installation directory.
- You can also copy the plot and paste into an image processing tool. To copy the plot, click on Edit in the Main Menu and then click Copy. The plot will be copied to the clipboard. You can then paste the copied image in any image processing tool and save it any required format, such as JPEG, PNG, BMP and so on.

1. Now in sample.dpf, double-click anywhere on the empty plot area.

2. The Properties view will show the size of the plot in the Current plot size field.

3. Drag the Outline view window and drop it below the Plot Editor.
4. Now resize the **Plot Editor** by dragging the left side (highlighted in red rectangle in the above screenshot) and the bottom (highlighted in green rectangle in the above screenshot) of the **Plot Editor** window. As you drag the **Plot Editor**, you can see that the current size in the **Properties** view will change accordingly.

**Note:** As you configure the **Plot Editor**, your plot is also resized.

5. Adjust the size of the **Plot Editor** to the size of the master-template, which is 528px width and 368px height (Remember, we established that the master template had these dimensions).
1.10.5.3 Preparing to Present

Now it is time to prepare for presenting. Follow the steps given below:

1. Zoom in on an area in the sample.dpf file. In this example, we are zooming in, on the end of the sample.dpf file.

2. In the Time Controller view, move the slider so that both the vessels are visible.

3. In the Time Controller toolbar, click on the Edit Time Controller Properties button.

4. In the Properties view, set the value of Small Step to 1 Minute and the value of Step Interval to ⅕ second. These settings mean that five times per second Debrief will step forward one minute, a rate that proves effective for this engagement, but others may need larger/smaller Small Step sizes.
1.10.5.4 Exporting Dynamic Scenario to PPTX

After you have prepared your plot for presenting, you can export a dynamic scenario to PowerPoint. We will learn how to export in this section.

1. In the Time Controller view, click on the record button (tooltip for this button will show Start recording for screen positions, for export) to start recording the engagement. The events will begin to unfold.

2. Click on the stop button at the time at which you wish to stop recording. The Debrief export dialog will display.

3. Specify the Export Location and enter the File name that you wish to export the plot to. Select the Open exported PPTX checkbox and then click Export. The PowerPoint file will open.

4. In the PowerPoint file, click on the ANIMATIONS tab, then click Preview. Alternatively, you can switch to the slideshow view.
1.11 Toolbars

In the same way that Debrief has menu options for the application’s main functions, there are 4 types of toolbars to assist you:

- **Main Toolbar** - Provides functions specific to the application/workbench.
- **View Toolbars** - These are specific to views and provide functions related to the selected view.
- **Fast View Toolbar** - Is available in the bottom-left of the screen and enables faster access to the selected views.
- **Perspectives Toolbar** - Are not used in Debrief at present, please refer to the User Guide for further information.

We will look at each of these in turn.

1.11.1 Main Toolbar

The main, or **Workbench**, toolbar contains a combination of a number of mini toolbars—kept apart by a vertical dotted-line; and, grouped buttons—kept apart by a vertical solid line (a separator); refer to the image below for further details. You can move the mini toolbars by clicking on the dotted lines and dragging horizontally or vertically; and, if you mouse-over any of the buttons, a button tooltip will appear explaining the main function of that button.
The mini toolbars are as follows (from left to right):

- **Save** - Saves the project with the currently saved name.
- **Create project** - Initiates the Create a project wizard.
- **Drawing Tools** - Has buttons which allow you to view plot layers or to place objects such as shapes, labels, range rings, tracks, and vectors onto the plot. Refer to the User Guide for further details.
- **Natural Earth** - Adds a Natural Earth reference backdrop to the plot, showing ocean contours, coastlines, countries and major cities.
- **Plot Management Tools** - This group of 9 buttons is split into 3 parts by separators—solid vertical lines between buttons. These buttons allow you to perform various management functions within the plot editor, including object repositioning, measuring, zooming in and out, etc.

From the image above, you can see that the section labelled Drag Mode contains 6 buttons; it’s important to note that only one button from this group can be selected at a time. The first 3 buttons of this group—drag track segment, drag whole component and drag whole feature—are used to drag and reposition objects on the plot. The next button to the right is used to measure range bearing between 2 objects; then, to the right of that, and to the left of the first separator, are the pan and zoom in buttons which allow you reposition and increase plot magnification, respectively.

To the right of the separator, in the second group, is the solitary zoom out button—its function is self-explanatory and this button can be used in conjunction with all the buttons in the first group.

Finally, to the right of the second separator, in the third group, we have the fit to window and redraw plot editor buttons, respectively—again, these are self-explanatory.
Note: as seen in the above image, if you have also loaded the Natural Earth set, this will show in the toolbar area also.

We won’t go over all of these functions, so refer to the User Guide when necessary.

1.11.1.1 Show/Hide the Main Toolbar

You can show/hide the main toolbar by clicking on Window > Show/Hide Toolbar.

1.11.2 View Toolbars

Each view also has its own mini-toolbar which provides functionality specific to that view.

1. Click anywhere on the NELSON track in the boat1.rep editor; the details of that track will appear in the Outline view.

2. In the Outline view, click on Track:NELSON to select it.

3. In the Outline view’s mini-toolbar, click on the empty check box, second from the right-end—the Nelson track in the plot editor will disappear.

4. In the same mini-toolbar, click on the check box with the tick in it—the Nelson track will reappear.

1.11.3 Fast View Toolbar

This particular toolbar contains what are called ‘fast views’—shortcuts to frequently-used views. By default, this toolbar resides in the bottom-left of the interface, underneath the Outline view (at the moment), but it can be dragged to any position around the outside edge of the interface.

1. Move your mouse cursor over the dotted vertical line on the Fast View toolbar and the cursor will change to a 4-direction cursor.
2. Left-click and drag it to the top-right corner of the UI (next to the button which says **Tactical Analysis**, or part thereof).

3. Release the mouse and the **Fast View toolbar** is now in the top right corner of the UI.

Now we will add a view to the toolbar:

4. Right-click on the **Navigator** view tab and select **Fast View**. The **Navigator** view button will now be added to the **Fast View** toolbar.

**Note:** You may find it helpful to keep the **Navigator** view in the **Fast View toolbar** as you will likely only want it visible when you need to see and open files/data.

You will notice that both these views have disappeared from the **Workbench**. This is because views in this toolbar become **toggle options**: you click once on the button to show it (toggle on), and click on it again to hide it (toggle off).

**Note:** These icons do look similar, so until they’re familiar, remember to mouse-over each to see the tooltip before clicking on it.

5. In the **Fast View toolbar**, click on the left-most button in the toolbar and you will see a drop-down list of all views in **Debrief**.

6. Select the **Properties** view and the button will display as the 3rd icon in the toolbar; the **Properties** view will also show.

You can drag any view and either stack or position it in the same way as we did with the **boat1.rep** and **boat2.rep** files before.
1.11.4 Perspectives Toolbar

By moving the Fast View toolbar to the top right, we nudged the Perspectives toolbar to the side. At the moment, the Tactical Analysis button is selected, but the other functions it offers are not currently used in Debrief. Refer to the User Guide for further details about this.

Now that we’ve covered views, menus and toolbars, we’ve seen that navigating, moving and manipulating objects with the mouse is standard functionality known to us all. Equally useful, but much less common, is the use of shortcut key combinations.

1.12 Shortcut Key Combinations

If, like me, you prefer to use the keyboard where possible, then you can use what are called keyboard combinations to perform common tasks. Keyboard combinations (or shortcut key combinations) consist of a sequence of keys which together perform a certain action in the program. For example, a common keyboard combination/shortcut in any program is Ctrl+S.

1.12.1 How to Find Out What the Shortcut Keys Are

To find out what other shortcut keys work:

1. Press the Alt key and look at the main menu. By default, the File menu is selected (it’s the first in the list); but, if you look at the initial letters of each menu item, they’re underlined.

2. Pick any one of those underlined letters and press that key on your keyboard. A drop-down menu will appear, and you can see the options in that menu.

3. View the list of shortcut keys by navigating to Window > Preferences > General > Keys.
1.13 Chart Features

You can use a number of chart features to enhance the plot editor and assist with your analysis. When you add a feature to the chart, these will appear in the Outline view under the name Chart Features. We will do this now.

1.13.1 Add a Chart Feature

Adding a chart feature will not open the Outline view, so we’ll do that first:

1. Press Ctrl+3 and start typing “outline” in the Quick Access dialog. When Outline - General appears, click on it to open the Outline view. The view will display and you can see the Chart Features folder has already been added from the previous step.

2. Click on the Chart Features folder to expand it and you will see the Grid object is already there.
3. On the main menu, click on **Chart Features** and select your required feature (I selected **Local Grid** - this differs from grid in that you can modify a local origin by changing the **Origin** attribute in the **Properties** view).

4. Your chart feature will be added to the **Outline view > Chart Features** and be visible in the plot editor.

From here, you can manage and manipulate the features.
1.13.1.1 Modify Local Grid

Now we'll modify the Local Grid origin as we would to reflect a custom exercise grid:

1. Double-click on Local Grid in the Outline view. The Properties view for the Local Grid will open.

2. Locate the Origin property and click on the down arrow.

3. Click on the Lat Minutes value and change it to 11.

4. Change the Lat Seconds value to 10.63.

5. Change the Long Minutes value to 41.

6. Then, change the Long Seconds value to 52.37, click away from the attribute to enter it.

The Local Grid origin should now be on top of the white square on the Nelson track.

Two of the more common and useful chart features include scale and grid.
1.13.1.2 Add Scale

When you add the scale (Chart Features > Scale), the Properties view for the scale will become the active view. Here you can modify a number of attributes, including:

- Color
- Location
- Scale
- ScaleStep, etc.

To change the color:

1. In the Properties view, click on Color Value, and an ellipsis button will show.

2. Click on the ellipsis button and the Color palette will show.

3. Select a different colour, one which will stand out against the editor background, then click on Ok.

4. The Color palette will close and the scale will change to the selected color.

To change the display units:

- In the Properties view, click on the Value cell next to the DisplayUnits attribute and a drop-down arrow will appear.

- Select your preferred units scale; I chose nm. Click away from the Value cell to enter this value. The scale on the plot editor will update accordingly.
1.13.2 Undo a Chart Feature

To undo a Chart feature, either:

- Click on Edit in the Main Menu and then select Undo [feature] or
- Use the shortcut key combination Ctrl+Z to undo the most recent action.

1.13.3 Temporarily Hide a Chart Feature

To temporarily hide a Chart Feature, either:

- Right-click on the feature itself in the Outline view and untick Visible, or
- Click on the feature in the Outline view and, in the Properties view, change the Visible attribute to No.

1.13.4 Remove a Chart Feature

To remove a Chart Feature, in the Outline view:

1. Click on Chart Feature to expand it. Right click on the Chart Feature that you want to delete.

2. In the pop-out menu, select Delete [feature]. The feature will be removed from the Outline view and the plot editor.

An example is shown in the below screenshot.
That concludes this part of the “Getting Started with Debrief” tutorial, either go over it again until you’re happy with everything covered, or use it as an aide-memoire and refer to it as needed. Next, proceed with the “Working with Debrief” tutorial.

Signed: _________________  Date: ________________
2. Working with Debrief NG

In this tutorial, we’re going to cover how we are going to work with Debrief and, in particular, defining workspace and viewing data. These two are essential to building your knowledge before moving to analysis tasks. Now let us learn all about viewing and working with data in Debrief:

2.1 Working with Data

In this, the second section of the Working with Debrief tutorial, we will first look at the following areas:

- Creating a New Plot
- Adding Data to a Plot
- Editing Data
- Analysing Sensor Data

2.1.1 Creating a New Plot

This tutorial will guide you through creating a new, blank plot in Debrief.

Check you have a Project

Plots are stored in projects, so before you create a plot, you must have a project. If you don’t have one, refer to Generating a Project for Your Data and follow the steps there.

Create New Plot

To create a new plot, in the Navigator view:

1. Right-click on the parent folder for your new plot and select New > Debrief Plot; the Create new Debrief Plot wizard will open.
2. Next, either confirm where you would like the plot to be stored—this is called the **plot’s container**—or select a different location by first clicking on the **Browse** button and then selecting the parent folder of your data directories.

3. Change the filename (as required).

4. Click on **Next**. The **Add Vectored background data** will display.
5. Now, select/deselect whether to use the **Natural Earth dataset**; click on **Next**. the Add Scale to Plot wizard will display.

6. Now you can choose whether to **Add Scale to Plot**, or not; including the following options: **color**, **display units**, and **scale location**.
If you select to include a scale, you must enter the **display units** and **scale location** to proceed to the next step. The **Add Coastline to Plot** wizard will be displayed.

7. Next you can choose whether to include a coastline or not. This option is not mandatory.

8. Click on **Next**. The **Add Grid to Plot** dialog will be displayed.
9. Here you can select whether to include a **grid**, the **grid color**, whether to show **Plot Labels**, and the **Delta—grid step size**.

10. Click on the **Finish** button. The changes will be applied, and the dialog will close.

**Finished**

Your new plot (with the filename you used earlier) will then display within your **Debrief** window. It is also located in the folder you specified in step 2 (above).

**Note**: All wizards make things easier for us, but all the steps above can be performed from the **Chart Features** menu in **Debrief** (Alt, C).

### 2.1.2 Adding Data to a Plot

**Debrief**'s **New Plot** wizard is effective at providing you with a preformatted backdrop to your analysis, but it doesn't load your data for you. We will now load some existing tracks to assist you in getting started.

**Check Sample Data**

To check sample data:

1. Open the **Navigator** view (using your mouse, or press **Ctrl+3** and type the search term).
2. Expand the folder that contains your existing Debrief files (these will be either REP or DPF).

![Image of Debrief Navigator]

**Note:** Valid Debrief files are flagged with a Debrief icon. Refer to the Debrief File Formats chapter in the Debrief User Guide to learn more about the two file types.

**Drag in a Simple Track**

If you've already got a plot open, close it now by clicking on the cross in the small tab-shaped icon above it. Don't worry about saving the tutorial files. Drag a rep track from your Navigator onto the blank plot area. The “boat1.rep” file is a simple starting point. The plot and any associated views will promptly update. When rep files are dragged in, you may be asked whether you wish to import the data in Over The Ground (OTG) or Dead Reckoning (DR) mode. For this tutorial, select OTG.

![Image of Select track mode dialog]

The plot for boat1.rep will be as shown below:
Drag in a Complex Plot

If you have multiple tracks to analyse, you can drag them onto the track plot you’ve just created. But for now, close the plot you have opened by clicking on the cross icon in its tab and press Don't Save when prompted.

Now, drag “sample.dpf” into the plot area. You'll see that this plot contains more complex graphical features.
Debrief File Types

Note: You've just encountered two file types, the Replay file type (.rep) and the Debrief file type (.dpf).

The two file types differ in that though the .rep file format is a very simple, column oriented text format ideal for passing around track data and for getting your raw track data into Debrief (see the Reference section in the user manual for more details), it isn’t suited to storing formatting data or user preferences; in contrast, with its textual XML structure and ability to store a wide range of data, the .dpf file format is.

As such, a typical flow is that data enters Debrief in .rep format and an analyst uses this data to create a custom plot; this plot is then stored in XML format as a .dpf file.

Your track data is now on the plot.

Note: Tracks can be dragged into Debrief from other areas, such as “Windows Explorer”. Refer to the Maintainer’s Guide section of the Debrief User Guide to learn how to support right-click track opening on MS Windows.

2.1.3 Editing Data

Check you have data

To check that you have data:

1. As before, open Navigator if it is closed (Ctrl+3 then clicking on Previous Choices, or typing in ‘navigator’ into the search field and clicking on it when it appears).

2. Confirm you have sample data-files in the Navigator view. If not, refer to the Viewing Data tutorial.

Open the sample plot-file

Double-click on “sample.dpf” in the Navigator view; the sample plot will open.
Fit to Window

You can also experiment with zooming in and out. Click the Zoom Out button once to zoom out, or you can put the plot into Zoom In Mode by clicking on the Zoom In button. Now, when you drag an area, the map will zoom in on that viewport.

Lastly, to make sure all of the data is visible, click on the Fit-to-Window toolbar button. You can read more about the toolbar buttons in the Moving Around the View section of the Debrief User Guide.

Note: if you hover your mouse cursor over any button, a tooltip explaining its function will display.

Ensure the Properties view is open

The Properties view is normally at the bottom left of Debrief. If it's there but not at the top of the 'stack', click on its tab to reveal it. If you can't find it, select Properties from the Window > Show View drop-down list (Alt,W,V,P).

Select an Item

You can select an item on the plot by double-clicking on it.

1. Identify the chart feature named Some Label, in the plot of sample.dpf. To the right of it is a red circle.
2. Double-click on the circle to select it. In the **Outline** view, you will see that the object **Label:** Some Label has been selected (Fig a. Shown below) and, in the **Properties** view, you can see that the properties for the object you selected are listed (Fig b. Shown below), including **Color**, **Font**, **Location**, etc.

![Fig a.](image1)

![Fig b.](image2)
3. Now, double-click anywhere on the **NOGO DELTA** rectangle to select that feature.

**Make a Change**

To change the rectangle’s label color:

1. Click once on the green rectangle next to **Label color**, under the **Properties** view. A button containing an ellipsis will appear.

2. Click on the ellipsis to open the **color editor**.

3. Next, select the red color, and then click on the **OK** button.

The dialog will close, the label color property will be updated, and the plot will redraw.

**Undo the Change**

Our new color doesn’t meet the **“NATO MilStd 12332 Sub-para 14g (2002 version) standard”**, so we need to undo it:

1. Click on the tab at the top of the **sample.dpf** plot to select it

2. Click on the **Edit** menu.

3. Select **Undo NOGO DELTA Label Color**.
The color of the label will now change back—you've undone 1 step.

Now that you've undone an action, if you click on the Edit menu again, you'll see there's now a Redo option available. This undo/redo feature is common to most programs and can be applied to many functions; the shortcut keys for these are **Ctrl+Z** and **Ctrl+Y**, respectively.

**Note:** The Undo button applies to the active Debrief view; so, to undo a change to a plot, you must first select the plot and make it active before pressing undo.

### 2.1.3.1 Edit a Position

To select a position within a track, double-click on that position and its editable attributes will appear in the Properties view. You can modify all of these attributes (as required). In this example, I have selected the track position **0600** (highlighted within the red rectangle) and its properties are shown in the Properties view.
Note: different elements have different properties, so you may have to scroll up and down the Properties view to see all available properties.

2.1.3.2 Edit an Entire Track

To edit an entire track, we use the Outline view. This makes selecting a plot easy. To open the Outline view:

1. Click on Window > Show View > Outline View.

2. In the Outline view, click once on the name of a track and the entire track's properties will be editable in the Properties view.

The Outline view is also useful for selecting and editing non-geographic entities such as a grid, scale, or background data-set.
Note: To learn how to rearrange view, refer to the section Moving Views.

2.1.3.4 Edit Directly from the Plot

It’s possible to edit certain attributes by right-clicking on an item on the plot. A popup menu will display showing a series of available options and commands. A drop-down menu is shown next to the current item's name and, from this drop-down menu, you'll be able to edit the respective attributes. For example, right click on the item BARRIER CHARLIE and the drop-down menu will display.

![Dropdown Menu Example]

Note: if you click on a vehicle position, a drop-down is shown for the parent track as well as the position itself. Also, remember that right-click functionality is available from anywhere within the program, and relevant options will be shown related to the tasks or actions you are currently undertaking.

Don’t forget to save

Anyone who has used computers for any length of time will have lost work at some point, so ensure you save your work regularly. You can save your work quickly by clicking on the floppy-disk icon on the main toolbar or by pressing Ctrl+S. Do this now.

Note: if the data you’re using is actually a .rep file, these cannot store formatting data, so you will be prompted to save the file in .dpf format.

2.1.4 Analysing Sensor Data

Check You have Data
To check that you have data:

1. Open **Navigator** (using your mouse, or **Ctrl+3** and typing 'navigator')

2. Confirm you have sample data-files in **Navigator**. If not, refer to the [Finding the sample data tutorial](#).

**Opening the Sample Sensor Tracks File**

To open the sample file, double-click on the "**sen_tracks.rep**" file. The file will then load. If the **Import** dialog appears, select **Over The Ground (OTG)** for both tracks, you will see the red and blue vessel tracks.

**Fit to Window**

The workspace can get cluttered quickly, so to make sure all of the data is visible, click on the **Fit-to-Window** button on the toolbar.

**Adding the SSK Track**

We will now add the sensor data. Starting from the **Navigator** view, drag the "**sen_ssk_sensor.dsf**" SSK sensor data file onto the plot. The **Import Sensor data** wizard will display.
Accept the default options in the wizard and click Finish.

**Note:** The data will be imported, but there will not be any visible change to the plot area. Since very high volumes of sensor data are typically loaded, sensor data is hidden by default.

**Adding the FF track**

Next, drag the **“sen_frig_sensor.dsf”** frigate sensor data file onto the plot.

**Note:** The data will be imported, but there will not be any visible change to the plot area. Since very high volumes of sensor data are typically loaded, sensor data is hidden by default.
Viewing the Sensor Data

To view the sensor data, in the Outline view:

1. Expand the tree for the two tracks called Frigate and New_SSK. Within each of these tracks, you will see named blocks of sensor data.

2. Now, we need to make each block of sensor data visible, so click on it to select it and then click on the Reveal Selected Items toolbar button. As you make each set of data visible, you should see its bearing fan appear in the plot area. Overall, there are six blocks of sensor data across the two tracks.

2.1.4.1 Sensor Formatting Options

Sensor lines can be formatted to change their color, their label, and location. This formatting can be applied to a single sensor line or a series of sensor lines. For
2.1.4.2 Format Sensor Data

Next, we will simulate formatting a series of bearing lines to represent the state of a particular sensor. In the **Outline** view:

1. Click on the arrow next to **Track:New_SSK**, then on the arrow next to **Sensors (1 items)**. The sensor bearings will display.

Example, change the color and label of the sensor line **Sensor:Frigate Optic5 (6 cuts)**.
2. Select the first five sensor bearings by first left-clicking on the top sensor bearing; and then, with the **Shift** key pressed, click on the 5th sensor: all 5 items should be selected.

3. Switch to the **Properties** view. This should show the editable properties for those bearings.
4. Click on the *Color* property, and select **yellow**. Click **Ok**.

You will see the sensor lines on the plot update.
2.1.4.3 Conduct a Plot-Lock

We will now simulate the process of dragging tracks so that their bearing fans match. In the UK this process is called a **plot-lock**, and in the US it's called a **tie-point**.

Firstly though, we must indicate which tracks we want to view the relationship between:

1. Right-click on **Track:Frigate** and then select **Make Primary**.

2. Right-click on **Track:New_SSK** and select **Make Secondary**.
These will both appear in the **Track Tote** view.

![Track Tote view](image)

### 2.1.4.4 Commence Plot-Lock

To commence plot-lock, click on the **Drag Track Segment** button on the Main Toolbar.

### 2.1.4.5 Start Dragging

The **Bearing Residuals** (also known as the **Stacked Dots** view) view will display and the cursor will be changed to a brown hand.
The **Bearing Residuals** view shows the bearing error for visible sensor bearing lines against the point on the target track nearest to that DTG.

When the cursor is over a track, it will turn green.

1. Click on the **Drag Whole Feature** button on the Main Toolbar.
2. In the **Plot Editor**, move the cursor over the north-west end of the blue track until the cursor turns green.
3. Hold down the mouse button and start dragging the track.

You will see the track and its sensor data start to hover as you drag it and, once you have finished moving the track, the bearing errors in the **Stacked Dots** view will update accordingly. When plot-locking tracks, your aim is to minimise the errors displayed on the graph. If you value some sensor data more than others, experiment with hiding the other blocks of sensor data (by making them invisible)—this will declutter the plot and the stacked dots, making plot-locking easier.

**Done**

Well done! You’ve completed the steps on loading, managing and formatting sensor data—supported by a healthy dose of plot-locking. Having come this far, you now know the initial steps of using **Debrief**. Sure, you’re a way off mastery, but that comes with a bit of practice, so be sure to run through the steps above again.

You now know about the views and how we can use them to our advantage, so it won’t take you as long the next time.

Now we’ll move on the next tutorial, **Controlling what you view**, where you’ll start using the analysis features of **Debrief**.

Signed: _________________  Date: ___________________
3 Controlling What You View

This tutorial will get you started with some of the analysis functionalities within Debrief which include the following:

- Filtering your View
- Assessing Primary and Secondary Tracks
- Viewing Time-related Vessel Tracks
- Analysing Time-related Calculated Data
- Narrative Data

3.1 Filtering your View

Ever-increasing data rates from multiple recording systems means your analysis plot will quickly become swamped. This tutorial will show you how to manage the volume and type of data displayed using Debrief NG's tools. We will be covering the following areas in this section:

- Viewing the Entire Data Plot
- Hiding Shape
- Hiding Entire Layer
- Filtering to a Time Period

Open Navigator

You will need to have the Navigator view open, so if it isn't visible, open it now (refer to the previous tutorial if you're still unsure on how to do this).

Open a Sample File

Now, double-click on “sample.dpf” in the Navigator view and the sample Debrief plot will open.
View the Entire Data Plot Area
To ensure you can see all of the data, click on the Fit-to-Window button either on the main toolbar or in the Chart Overview view toolbar.

Open the Outline View
You will need the Outline view for this exercise, so if it isn’t already open, open it now by either clicking on Window > Show View > Outline, or by using the shortcut key Alt+Shift+Q,O.

3.1.1 Hiding a Shape
At the top of the Outline view is a toolbar of operations that can be applied to plot items.

- In the Outline view, you can see a list of items, including one called Misc (5 items). Click on the arrow to the left of it and the group will expand.

- Select any item within that group and then click on the empty rectangle button in the Outline view toolbar (next to the +2 button). You will see that the tick next to the element and the corresponding shape on the plot disappear.
Finally, another way of doing this is to right-click on an item and select the item name and tick or untick the field **Visible**, as required.

**Note**: You can show/hide more than one item at a time by holding down the **Ctrl** key and clicking on multiple items.
3.1.2 Hiding Entire Layer

Next, experiment with hiding the whole layers. To hide an entire layer, you can either:

- Select one of the tracks in the **Outline** view and click the **Hide selected items** box in the **Outline** view toolbar.

![Outline view with Hide selected items option](image)

- Right click on the layer that you wish to hide and click the layer name and then untick **Visible**.

![Outline view with right-click options](image)

**Note:** You can expand each track to see the series of positions within. Once expanded, you can select a series of points (each of which represents a time-period) to be hidden/revealed. However, this is just one way of doing it.
3.1.3 Filtering to a Time Period

We will now filter the plot to a particular time period.

1. Open the **Time Controller (Window > Show View > Time Controller)** and click on it. You can see that the lower section of the Time Controller consists of a pair of sliders used to mark the start and end time of a variety of tasks.

2. Click **View Menu** and select **Filter to period**.

3. In the time period markers (the part underneath the **Time Controller's slider**), drag the start and stop markers to different positions. In the following example, the starting marker is at 120700 and ending marker is at 120947.
As you do this, you’ll see the shaded portion adjust to the selected period: this represents a custom time period and is visible on your plot. You can drag this shaded section to move your **windows** forwards and backwards.

If you hold down the **Shift** key while you move elements on the time plot, they will **snap** to the hour lines.

**Note:** Before you either close the file or go onto the next tutorial, drag the time sliders back to their start and end positions.

Hopefully you found the above steps easy to follow. Controlling what you are viewing is an essential component of working effectively with **Debrief**, and an essential skill for both data analysis and collation of information for transfer to presentation applications like MS Word or MS PowerPoint.

### 3.2 Assessing Primary and Secondary Tracks

In the next part of the tutorial, we will look at what are termed as primary and secondary tracks. These are not standard terms, but are used to specify or determine the relationship between tracks in **Debrief**. The primary track is always the track that is the focus of attention, with calculations involving secondary track(s) performed relative to it. All these calculations are shown in a view called the **Track Tote**. In this tutorial, we will look at setting up primary and secondary tracks, moving tracks through time, etc. So, we will be looking at the following areas in this section:
Open Navigator

If the Navigator view isn’t visible, open it.

Open the Sample Plot File

If you closed the sample.dpf file at the end of the last exercise, locate it in the Navigator view and double-click on it to open it again.

Fit to Window

To make sure all of the data is visible, click on the Fit-to-Window toolbar button.

3.2.1 Viewing Track Tote

In the centre section of the left hand column in Debrief is the Track Tote. If it’s not visible, open it by clicking on Window > Show View > Track Tote.

However, if it’s just obscured by other view panels, click on its tab to bring it to the front.

3.2.2 Understanding Track Tote

The Track Tote contains information about selected tracks within the active plot. Though the actual limit on the number of tracks that can be displayed is determined only by the memory capacity or capability of your system, the Track Tote itself will display a minimum of at least two columns: 1 for the active track and 1 for the Attribute column (an optional Units column can be added, if required).

In our sample.dpf example, the left-side track column contains the primary track data for Nelson and the right-side column contains the secondary track data for Collingwood. All calculation data is taken from the corresponding track (the calculations themselves are explained in greater detail in the Debrief User Guide).
3.2.3 Moving Track Through Time

Now we will use the Time Controller to change the time.

1. If the Time Controller is not visible, open it.

2. Drag the time-slider right and left, and you will see the calculated data fields update (you will also note the vessel positions on the plot—the white squares—also move).
3.2.4 Removing a Track from the Tote

Now we will remove the Collingwood secondary track from the tote:

1. Right-click on any of the cells in the Collingwood column.

2. Select Remove this track from the drop-down list.

The Collingwood secondary track will be removed, leaving the one remaining Nelson track.
3.2.5 Adding a Track to Tote

To add a track to the tote:

1. Open the Outline view - Take note of the '1' and '2' buttons on the view's toolbar, as they're currently disabled.

2. Click once on the track you just removed from the tote (Track:COLLINGWOOD) and both buttons will be enabled. You can now make the current track as primary or secondary.
3. Make your choice now and assign it as either **primary** or **secondary**. As you do so, it will appear in the tote once more.

**Note**: Any data-item that has time and location attributes can be placed on the tote (not just tracks): Items such as circles and labels are particularly suited.

**Note**: The next tutorial also uses the **sample.dpf** plot, so if you plan to continue now, you can proceed with that; if you don’t, close it and don’t save any changes.

### 3.3 Viewing Time-related Vessel Tracks

**Debrief** offers more than just a static overview of vessel tracks and it also allows you to control the time period of data shown. We will be looking at the following areas in this section:

- **Moving Slowly Through Data**
- **Moving Quickly Through Time Period**
- **Experimenting with Time Formats**
- **Changing Plotting Modes**
- **Working with Time Periods**
- **Selecting Precise Time**
- **Time Controller’s Editable Properties**
- **Bookmarking the Current Time**

**Open Navigator**

If the **Navigator** view isn’t visible, open it.

**Open the Sample Plot File**

If you closed the plot earlier, double-click on “**sample.dpf**” in the **Navigator** view, and the sample plot will open.

**Fit to window**
To make sure all of the data is visible, click on the **Fit-to-Window** toolbar button.

### 3.3.1 Viewing the Time Controller

We looked at the **Time Controller** in the **Filtering your view** tutorial previously. So if it's not currently visible, open it.

**Confirm You’re in Normal ‘Stepping Mode’ Time**

The **Debrief Time Controller** has 2 time stepping modes: **Normal Mode** and **Snail Mode**. Buttons for these modes are located on the view toolbar:

1. **Normal Mode** shows all exercise data.
2. **Snail Mode** shows the current position and recent points, and is used for detailed analysis around a specific time.

- Click on the left-most button to select **Normal mode**.

### 3.3.2 Moving Slowly Through Data

Above the current time indicator, are a series of button controls similar to the pause/play/rewind buttons you'd find on any music or DVD player.

- Click on the buttons and you'll see the green date and time value adjust accordingly; also note the movement of the white rectangular highlight along the vessel tracks to denote the vessel position at that time.

### 3.3.3 Moving Quickly Through Time Period

- If you want to move quickly through the time period, drag the time-slider in either direction and see how quickly the white rectangular highlight moves along the vessel tracks, as well as the time change shown in the **Time Controller** view.
In addition, if you also have the Track Tote view open, notice how it's updating to reflect the current time.

### 3.3.4 Experimenting with Time Format Options

The **Time Controller** also has a drop-down menu at the end of the toolbar. Within this drop-down are additional sub-menus, including **DTG Format**, where you can select the format in which the current time is displayed, and **Time Slider Increment**, where you can adjust the time increment used for moving through the plot.

1. Change the **DTG format** so that you can see the full Year/Month/Day for the current DTG.

2. Next, change the **time slider increment to 15 minutes**, so that you can move through the plot much quicker.

### 3.3.5 Changing Plotting Modes

To change plotting modes:

1. Within the **Time Controller's** drop-down menu, click on **Plotting Mode**.
2. Select **Primary Centred/North Oriented**.

![Image of Time Controller](image)

3. Click on the **Snail mode** button 🐌.

4. Now, move the slider forwards and backwards and watch the plot change.

**Note**: The **Plotting Mode** is selected independently of the mutually exclusive **normal** and **snail** Display Modes.

### 3.3.6 Working with Time Periods

Now we'll look at the time period selector within the **Time Controller**. Though it is used to select a period of time, it doesn’t function in quite the same way as the other controls do. You see, when you change the other controls, you see something happening because it’s affecting current operations; whereas when you change the time period, you’re changing the period that will be used for subsequent operations.

For example:

1. Select a time period of **120700 to 121000**.

2. From the **Time Controller's** drop-down menu, select **Export calculated data to clipboard**. The 3-hour's worth of calculated data from this selected period has just been copied to your system clipboard. You can now paste that into your preferred analysis software, such as MS Excel.
3.3.7 Selecting Precise Time

It can be difficult to select precise times using the slider, but there is another way:

1. Double-click on the start/finish time marker triangle - the value will then become editable in the Properties view (below the Time Controller).

2. Modify the time value and then click away from the property to enter the value.
Or, if you're just trying to move the time value a very small amount:

1. Press the Ctrl key on your keyboard.

2. Double-click on the start/finish marker to display a mini time-slider.

3. Adjust it to the time you require, then click away to enter this time value.

### 3.3.8 Time Controller's Editable Properties

As we’ve already seen, the Time Controller's drop-down menu contains a series of sub-menus. Some of these sub-menus have an Edit properties element, which lets you control various aspects of temporal data analysis.

For example, once you've selected an item from the properties drop-down menu, its attributes will then become editable in the Properties view (open it if it's not visible).
Note: The item only appears in the Properties view if the Time Controller is the active view. Remember, the currently active window or name tab is highlighted blue. If it isn’t selected, click on the tab to do so.

3.3.9 Bookmarking the Current Time

Debrief NG lets you insert a bookmark attached to a particular DTG in the current plot. This is useful if, let's say, if you're analysing a particular exercise and want to record some interactions.

1. In Normal view mode, move the time-slider to 121011 hrs - this is the point when RED/NELSON detects BLUE/COLLINGWOOD and reacts.

2. Select Add DTG as bookmark from the Time-Controller's drop-down menu.

A dialog box will open prompting you to enter a description for the DTG Bookmark.
3. Enter First contact, then press OK.

4. Now, move the time slider to 121129.

5. Select Add DTG as bookmark again and enter a bookmark title Plotlock start.

Though you’ve now entered these bookmarks, they won’t be visible until you show the Bookmarks view. To view the Bookmarks:

1. Click on Window > Show view > Bookmarks.

   ![Bookmarks view]

2. Now, double-click on either bookmark to move to that time.

3. Save (Ctrl+S) and close your plot.

**Note:** You can store as many bookmarks as you like, and all stored bookmarks can subsequently be accessed and used across all your analysis plots, even if a different plot is being edited.

**Done**

If you found the above tutorial easy, then great! Not only is the Time Controller a very capable panel that provides a wide range of functionality, but it’s also one of the more complex parts of Debrief. So, once you’ve conquered that, you’re making great progress.

**Note:** We use the sample.dpf plot again in the next tutorial, so if the time sliders are not at their start and end positions, please adjust them now.

### 3.5 Analysing Time-related Calculated Data

Debrief is capable of producing analytics far beyond the traditional graphical track plots; all it needs is data. The most obvious derived products are the analysis plots - graphs showing time versus either a recorded data value or a calculation based on a specific set of data-values. In this tutorial we will look at how to do just that. We will be looking at the following areas in this section:
3.5.1 Process Overview

To be able to analyse the data correctly, we first need to tell Debrief what information is required, such as:

- the time period we want plotted
- which participants to plot data for
- what type of data to plot
- which is the primary track (for relative calculations).

But, before we can do that, we need the data; so, as always...

Open Navigator

If the Navigator view isn’t visible, open it.

Open the sample plot-file

Double-click on “sample.dpf” in the Navigator view and the sample plot will open.

Fit to window

To make sure all of the data is visible, click on the Fit-to-Window toolbar button.

Open the Time Controller

As we said in step 1, one of the attributes we need to specify is the time period; and, to do that, we need the Time Controller.

If is isn’t open, click on Window > Show View > Time Controller.

Select the required time period

Now we need to select the required time period: adjust the start and end markers to select the period 120800 to 121100 respectively.

Note: Remember, holding down the Shift key makes the sliders snap to the hour markers.

Open the Outline View
Next, we need to indicate what tracks we want to see information for. In the bottom left hand corner of Debrief you should find the Outline view. If it isn't visible, click on Window > Show View > Outline.

### 3.5.2 Selecting Required Tracks

In the Outline view:

1. Click on **Track:COLLINGWOOD** track to select it.

2. Then, holding down the Ctrl key, click on **Track:NELSON** track to select that also.

### 3.5.3 Opening the XY-plot

Now we will open the xy-plot:

1. Right-click on the selected items and, in the drop-down menu, click on View XY Plot.

2. The View time-variable plot dialog will open; select Range from the available attributes.
3. Click on **OK** and the **Select primary** dialog will open.

4. You must designate either **Track: COLLINGWOOD** or **Track: NELSON** as the primary track for this plot. For this example, select **Track: COLLINGWOOD** and click **OK**.

As **Debrief** calculates the data and relationships between multiple tracks, it needs to know which track is the primary subject to be able to do this.

5. The **Collingwood Range v Time plot graph** will display.
3.5.4 Navigating Around the Plot

To navigate around the plot area:

- **Zoom in** - To zoom in on the graph, click on the top-left corner, hold down the mouse button, drag it to the bottom-right corner and release the mouse or right-click on the graph and select *Zoom in >[Both Axes | Domain Axis | Range Axis]*)

- **Zoom out** - To zoom out of the graph, click on the bottom-right corner, hold down the mouse button, drag it to the top-left corner and release the mouse or right-click on the graph and select *Zoom out >[Both Axes | Domain Axis | Range Axis]*).

Alternatively, another method of zooming out is to click on the...

- **Fit to Window** button - you've already used this before.

**Customisable**

In addition, you can also experiment with the other commands present on the view toolbar, and even configure and customise the graph to use your preferred fonts and titles.

1. On the *xy-plot* view toolbar, either click on the **Change Editable Properties** button

   or click on the view's drop-down menu and select **Configure plot**; the **Chart Properties** dialog will display.
Note: Properties view must be open to see the chart properties.

2. Now, in the **Title Text** field, change the title to **Collingwood vs Nelson - Calculated Range**.

3. Click away from the **Title Text** field to see the change. You will see the graph title update.
3.5.5 Measuring Range and Bearing

As you've seen, you can perform a number of functions in the Range vs Time plot graph, but there is another way to measure range and bearing, and that's using the Measure range bearing button. This option is much quicker as you don’t have to go to the trouble of designating primary and secondary tracks. In addition, this option also allows you to measure the range and bearing between any 2 points on the plot editor. To do this:

1. On the **Main toolbar**, click on the **Fit to window** button.

2. Still on the **Main toolbar**, click on the **Measure range bearing** button.

3. Now, in the **plot editor**, left-click and hold on the point you wish to measure from.

   In this example, click on the bottom left corner of the green NOGO DELTA rectangle (it doesn’t have to be exact, this is purely for illustrative purposes).

4. Drag the mouse to the point you wish to measure to, which in our case is the NW tip of the white **other line** object.

   As you drag the mouse, you will see the calculated results appear in the mid-point of the connecting objects as well as in the bottom right of the plot editor status bar (mine shows **6.09 nm 153°** at the tip of the white line). This will remain there until you click elsewhere in **Debrief**.
5. If you release the left mouse button, though the line and results will disappear from the editor, the results will still show in the status bar.

[12329.24yd 153°]

However, if you don’t release the left mouse button and right-click at your destination point, you will see a pop-out menu with a number of options.
6. Either select the option you require, or you can press the Esc key on your keyboard to close the pop-out menu and leave the measured range and bearing on the plot. This plot line will disappear if you perform some other function in Debrief.

### 3.5.6 Tracking Other Objects

Other objects as well as tracks can be plotted, such as tracking the proximity of multiple vessels to a fixed point object (such as a sensor). To do this:

1. Insert a label annotation on the plot by clicking on **Drawing > Label**.

The Adding a new Drawing Feature dialog will display.
2. Select **Annotations** and click **OK**.

3. In the **Properties** view, rename the label to **Sensor 1**.

We will now move the sensor to a new position.

4. Press **Alt+3** on your keyboard to select the **Drag Whole Feature** option, and the mouse cursor will change to a brown hand.
5. Move the mouse over **Sensor 1** until the hand changes to green. Now you can move the sensor.

6. Drag and drop it to wherever you wish on the plot; somewhere close to the 2 tracks perhaps.

Now, in the **Outline** view, if it is not selected, click on **Sensor 1**.

7. To select all the tracks, press **Ctrl** on the keyboard and click on the tracks **Label: Sensor 1, COLLINGWOOD, and NELSON**. Right-click and select **View xy plot**.

The **View time-variable plot** will display.
8. Select **Range** and click **OK**. The **Select primary** dialog will display.

9. Select **Label:Sensor 1** as the primary track and click on **Ok**.

You will now see the **Sensor 1 Range vs Time plot** showing how close the vessels came to the sensor and at what times.

Remember, this plot is constrained by the time period selected in the **Time Controller**. Let’s extend this now.
1. Drag the time sliders to the full exercise time period (0500 - 1145).

![Time Controller](image)

2. In the Outline view, select the tracks Label: Sensor1, Track: COLLINGWOOD, Track: NELSON and right-click and select View xy plot.

The View time-variable plot dialog will display.
3. Select **Range** and click **Ok**.

The **Select primary** dialog will display.

4. Designate **Label:Sensor 1** as the primary track again, and then click **OK**.

Now you can see the vessel’s proximity to sensor 1 throughout the entire exercise.
3.6 Narrative Data

Narrative data refers to time-stamped textual data, i.e., comments that are added during an exercise. One use of this is that it allows an overview of events during an exercise, but there are other possibilities also, such as readings from a sensor or control messages from a weapons system.

3.6.1 Loading Narrative Data

You load narrative data in the same way as other .rep files, by dragging-and-dropping the file into the plot editor.

For this section, we need the “boat1.rep” file, so:

1. Close the sample.dpf file and discard any changes.

2. In the Navigator view, drag and drop the “boat1.rep” file into the plot editor.

3. Select Over the Ground (OTG) option, and click on Ok.
If your **Outline** view isn’t open, open it now.

4. Now, still in the view, drag-and-drop the “**narrative.rep**” file onto the plot editor. In the **Navigator** outline view you will see **Narratives (50 items)**.

Now we need to open the **Narrative Viewer** itself:

5. Press **Ctrl+3** to open the **Quick Access** dialog, type ‘narrative’.
6. Select **Narrative Viewer - CMAP** when it appears. The **Narrative Viewer** will display below the plot editor. In the viewer you will see the grid of narratives, including **Time**, **Source**, **Type**, and **Entry**.

3.6.2 *The Narrative Viewer*

Within the narrative viewer, there are a number of functions that can be performed, including **filtering by source**, **filtering by type**, and **two-way linking of narrative to current time**; we will come to those soon. First though, we will look at viewing and modifying the recorded narrative data. To do this:

1. Double-click on any cell in the row you wish to view. The attributes for that row will then display in the **Properties** view.
2. With the exception of Type, you can now modify all attributes in the Properties view. We will change the color of the narrative entry where Nelson detects the first target zig to ‘Debrief blue’.

3. In the Narrative Viewer, scroll down to the 121037 narrative entry, you will see TARGET ZIG DETECTED in the Entry field.

4. Double-click on that row and its properties will show in the Properties view.

5. In the Properties view, click on the value cell next to the Color attribute and an ellipsis button will appear. Click on it to show the Color dialog.

6. Click on the Define Custom Colors button then, in the Red, Green, and Blue fields, enter 29, 56 and 96, respectively.

7. Click on Add to Custom Colors. Then click on that color in the Custom Colors palette to select it.

8. Click on Ok to close the dialog and return to the Properties view. Click away from the Color attribute to update the color change - the narrative entry will update accordingly.

We will now look at common functions in the Narrative Viewer.
3.6.3 Filtering by Source

Debrief allows you to filter the data by source. This is useful if you have multiple tracks on your plot and you don’t wish to view narratives from all sources.

1. In the Narrative Viewer, click on the drop-down arrow to the right of the view toolbar and the view menu will open.

2. Click on Set source filter and the Filter by: source dialog will display. Here you will see two columns: Available items and Show entries matching.

3. Select the entry you require from the left Available Items column, or select the entry you don’t wish to view from the right Show entries matching column.

4. Click on the single chevron button to transfer items individually from one column to the other, or the double chevron button to transfer all at once (I selected Nelson).

5. Once you have the sources you require in the Show entries matching column, click on Ok.

6. The narrative entries for the selected sources will populate the Narrative Viewer.

3.6.4 Filtering by Type

In the same manner as Filtering by source, you can also filter by type (of narrative entry). The type of narrative entry is an optional parameter, and the first data-file we used doesn’t contain type data. So, we’ll remove this narrative data, and load some suitable data.

1. In the Outline view, right-click on Narratives (50 items) and select Delete Narratives; this will remove this narrative file from the view.
2. Now, in the **Navigator** view, locate the “narrative2.rep” file and drag and drop it into the editor. **Narrative (19 items)** will display in the **Outline** view.

3. If the **Navigator Viewer** is blank, close it and reopen it to refresh the display; the entire set of narrative data will be listed.

4. In the **Narrative Viewer**, click on the drop-down arrow for the view menu.

5. Click on **Set type** filter and the **Filter by: type** dialog will display. As before, you will see two columns: **Available items** and **Show entries matching**.

6. Select the entries you require and click on the chevron buttons to transfer the items individually or as one from one column to the other (I selected **CMD_COMMENT**).

7. Once you have the sources you require in the **Show entries matching** column, click on **Ok**.

8. The data for the filtered narratives will populate the **Narrative Viewer**.

9. If you double-click on a data cell, that information will display in the **Properties** view. Note the **Type** attribute will show **CMD_COMMENT**.

**Note:** a quick way of accessing either of the **Source** or **Type** filter options is to double-click on the respective header cell in the **Narrative Viewer**.

### 3.6.5 Two-way Linking of Narrative to Current Time

The **Narrative Viewer** also allows you to link the narrative to the time currently displayed in the plot editor. This way you can follow the exercise through, see what comments have been made at which point, and obtain a better understanding of events for your own analysis.

1. In the **Narrative Viewer** toolbar, click on the end-right button to turn on this feature (the tooltip says **Whether to control the current time**).

2. In the **Time Controller** view, advance the time and not only will you see the vessel positions change on the track, but also the narrative will advance accordingly.

Because we have a filtered set of narrative entries, it won’t advance that quickly through the data entries, so let’s add some more data types.

3. Click on the drop-down arrow for the **View** menu.
4. Click on **Set type filter** and the **Filter by: type** dialog will display. Add **SONAR_COMMENT** and **NEW_CONTACT**. Click on **Ok**. The **Narrative Viewer** will show more data.

5. As you advance the track now, you can see where the vessel is for each data entry point.

### 3.6.5.1 Jump to a Specified Time

Another good method for analysing scenario events is to jump to specific times in the narrative. With the two-way linking mode still turned on, you can do this by double-clicking on a narrative entry.

1. Double-click on the **120612 NELSON** narrative entry, the one marked **NEW CONTACT...@**. You can see the vessel positions where red contacts blue. The time slider also jumps to this time.

2. Next, double-click on **120957 Collingwood, NEW_CONTACT, SUSPECTED DETECTION OF RED** and observe the vessel positions when blue sees red for the first time.

3. Six minutes later, blue notices that red has zigged (**121013...SUSPECT TARGET ZIG**).

I think you’ll agree, it’s a good way of following a scenario by aligning specific narratives to track positions.

**Done**

That’s the essential components of the **Narrative Viewer** complete; in the next tutorial we will look at **Single-sided Reconstruction** scenarios.
